Agenda

1 | *Stakeholder analysis*

2 | *SWOT analysis*

3 | *Potential risks*

4 | *Probability-Impact matrix*

5 | *Risk mitigation plan*

Business Owner

Involve in sprint-review,
primary decision-maker on scope

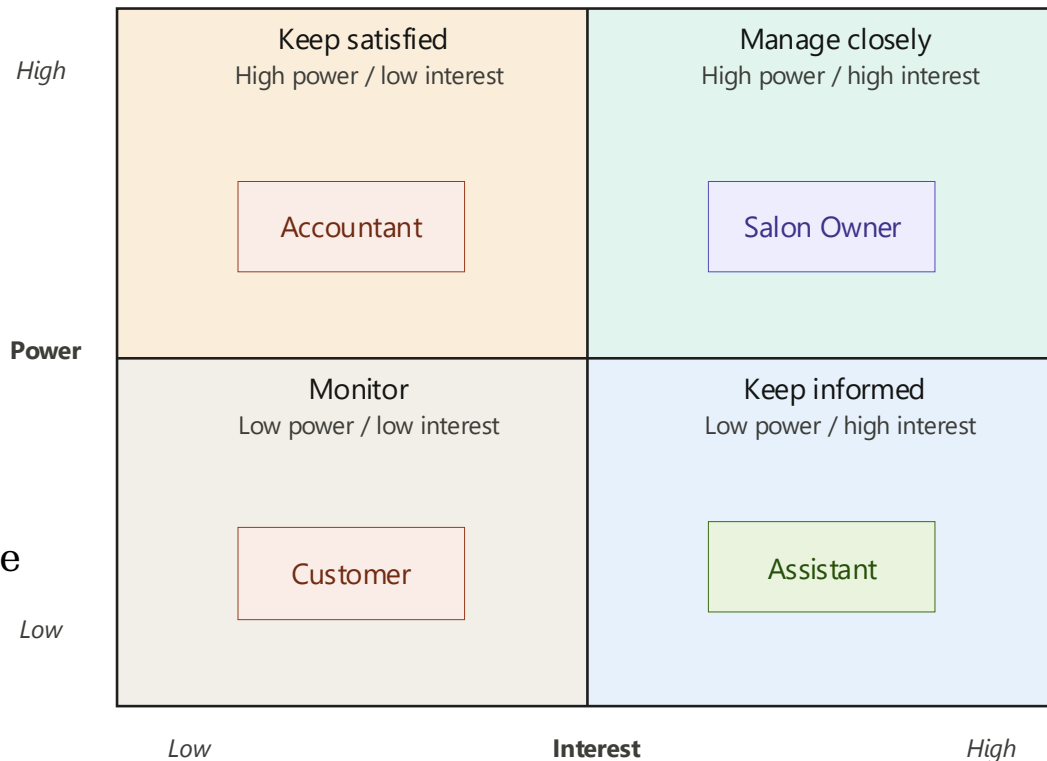

Accountant

deliver financial view accurately,
keep interface simple

Assistant

Demo each sprint,
ensure booking flow works for daily use

The assistant (Harriet) handles the majority of incoming booking calls after school hours — UI clarity in the booking flow is critical to her daily efficiency.

<i>Positive</i>			
<i>Internal</i>	Strengths - Low technical barrier - Accountant gets direct access to financial records - No manual cross-checking - Assistant/Business Owner can manage bookings - File persistence	Weaknesses - Low technical literacy of users - No existing digital data to migrate - Single laptop, no backup system - Manual calendar as fallback risk - No network, offline only - No customer data encryption	
	Opportunities - Upgrade to online booking platform - Web shop implementation - Advanced customer data insights - New sales strategies (newsletter, discount vouchers etc.)	Threats - Adoption resistance if UI is confusing - Data loss if file persistence fails - Scope creep from nice-to-haves - Potential privacy concerns	<i>External</i>
		<i>Negative</i>	

<i>Source</i>	<i>Description</i>
<i>Threat</i>	If date/time logic has errors, then double-bookings occur
<i>Threat</i>	If the Assistant/Business Owner resist using the system, then adoption fails
<i>Threat</i>	If menu navigation is unclear, then the Assistant/Business Owner might enter wrong input
<i>Weakness</i>	If the data file corrupts or is deleted, then all appointment history is lost
<i>Weakness</i>	If the laptop fails, then the system is completely unavailable
<i>Weakness</i>	Steep transition period from manual calendar to digital solution since there's no way to import data
<i>Weakness</i>	Initial solution doesn't include data encryption which limits the customer data usage

<i>Risk (if... then)</i>	<i>(I)mpact</i>	<i>(P)robability</i>	<i>Score</i>	<i>Action</i>
Laptop failure -> System unavailable	5	2	10	Mitigate
File corruption -> Data loss	5	2	10	Mitigate
Date/time logic errors -> Double bookings	4	2	8	Mitigate
Incorrect payment registration -> potential accounting issues	3	2	6	Mitigate
Unintuitive console UI -> revert to manual calendar	2	3	6	Mitigate
Plain text exposes customer data -> privacy concerns	3	2	6	Mitigate
Bookings leave no trace -> Accountant cannot reconcile missing payments	4	1	4	Accept

<i>Risk</i>	<i>Action</i>	<i>Owner</i>	<i>Early Warning</i>
Laptop failure	Weekly backup	Business Owner	Laptop instability -> backup
File corruption	Save-on-write, DoD restart test	Developer	Save-on-write/restart test fails -> fix top priority
Date/time logic errors	Input validation	Developer	Validation test fails -> escalate to full team
Incorrect payment registration	DoD validation test	Developer	DoD validation test fails -> escalate to full team
Unintuitive console UI	Test with non developer	Developer	Feedback -> Simplify menu structure -> Test
Plain text exposes customer data	Only store necessary customer data	Developer + Business Owner	If additional customer data requested -> encryption dialogue with Business Owner
Bookings leave no trace	Accepted	-	-

Questions?

Thank you.
